1. Test Equipment Required for Servicing	6

INTRODUCTION

This service manual is intended for use by authorized warranty stations. The manual contains service information for the Marantz Model 33 Stereophonic Console, manufactured by the Marantz Company, a subsidiary of Superscope Incorporated, Sun Valley, California 91352.

Adjustment, maintenance, and troubleshooting information listed herein should be attempted only by the experienced technician, one knowledgeable in solid state theory and the use of test equipment. All instructions should be read carefully and understood fully before proceeding with any service.

Symptoms (and their remedies) listed in the troubleshooting section are those which might occur in some units. As the Marantz Company becomes aware of other field problems, supplementary service bulletins will be issued to all stations. To improve this service, all problems (and their solutions) not covered in this service manual should be brought to the attention of the National Service Manager at our Sun Valley location.

LOW-LEVEL AMPLIFIER

Program source signals from the 6 jacks (3 low level and 3 high level) on the rear panel are supplied to the SELECTOR switch. The 3 low-level inputs are applied to the low-level amplifier. A section of the SELECTOR switch selects the appropriate (NAB, RIAA) equalization network. The low-level amplifier comprises a single-ended differential amplifier (Q101, Q102), an inverter (Q103), and a complementary-symmetry pair (Q105, Q106). This amplifier provides a gain of 40 dB. The output of the low-level amplifier is applied to another section of the SELECTOR switch.

This section of the SELECTOR switch applied either the output of the low-level amplifier or one of the high-level inputs to the TAPE MONITOR switch.

The TAPE MONITOR switch applies either the TAPE IN (or DUBBING IN) or program source signals to the mode switch. The DUBBING IN jack contains a built-in switch which disconnects the TAPE IN signals when a plug is inserted into the jack. The signal is applied, in turn, to the MODE switch; BALANCE control and SCOPE OUT jacks; and VOLUME control.

The MODE switch applies the CHANNEL B signal simultaneously to both amplifier channels when in the "B" position; the CHANNEL A signal simultaneously to both amplifier channels when in the "A" position; the CHANNEL A signal to the CHANNEL A amplifier and the CHANNEL B signal to the CHANNEL B amplifier when in the "STEREO" position; the CHANNEL A signal to the CHANNEL B amplifier and the CHANNEL B signal to the CHANNEL A amplifier when in the "STEREO REVERSE" position; or both CHANNEL A and CHANNEL B signals simultaneously to both amplifier channels when in the "A&B" position.

The BALANCE control is a full range graphic slide-type control that permits full attenuation of either channel without affecting the other channel. The output of this control is applied to the VOLUME control and the HEADPHONE level control. The VOLUME control is a precision tracking graphic slide-type control which maintains the stereo balance dictated by the BALANCE control (within 1 dB) from maximum to -65 dB below maximum. The output of the VOLUME control is applied to the X10 amplifier.

CIRCUIT DESCRIPTION

The Model 33 comprises a LOW LEVEL AMPLIFIER, a TONE AMPLIFIER, a X-10 AMPLIFIER, a HEADPHONE AMPLIFIER, a HIGH AND LOW FILTER CIRCUIT, and an OUTPUT AMPLIFIER which operate independently for each channel (except for Tone Controls, both channels are simultaneously affected by the Front Panel controls and jacks). The POWER SUPPLY CIRCUIT supplies the required power to each channel from a common source. In the following circuit description, only CHANNEL A will be discussed; CHANNEL B is functionally identical.

X-10 AMPLIFIER

The X10 amplifier (Revision 1) comprises an FET-driven single-ended differential amplifier (Q106, Q107, Q108, Q109) followed by an inverter (Q110) and a complementary symmetry pair (Q111, Q112). The X10 amplifier (Revision 2) comprises a single-ended differential amplifier (Q107, Q108) followed by an inverter (Q110) and a complementary symmetry pair (Q111, Q112). The X10 amplifier provides a gain of 20 dB. The output of the X10 amplifier is applied to the TONE CONTROL switch and the tone amplifier.

With the TONE CONTROL switch set to OUT, the output of the X10 amplifier is applied directly to the DUBBING OUT jack and the filter center channel board.

TONE AMPLIFIER

The output of the X10 amplifier is applied to the unity gain tone amplifier through a coupling capacitor (C121). The tone amplifier comprises a single-ended differential amplifier (Q113, Q114), an inverter (Q115) and a complementary-symmetry pair (Q116, Q117). The frequency response of the amplifier is adjusted by the BASS (R18, R20) and TREBLE (R19, R21) controls as indicated in Figure 1.

With the TONE CONTROL switch set to LOUDNESS, audio corrections approximately equal to the Fletcher-Munson loudness contour are inserted via a tap at the volume control.

With the TONE CONTROL switch set to IN or LOUDNESS, the output of the tone amplifier is applied to the DUBBING OUT jacks and the filter/center channel board.

HEADPHONE AMPLIFIER

Signals from the BALANCE control are applied to the HEADPHONE level control (R12). This control adjusts the level of the signal applied to the headphone amplifier. The headphone amplifier comprises a series pair (Q118, Q119) and a constant-current source (Q120). This amplifier provides a gain of 22.3 dB and has a "flat" frequency response.

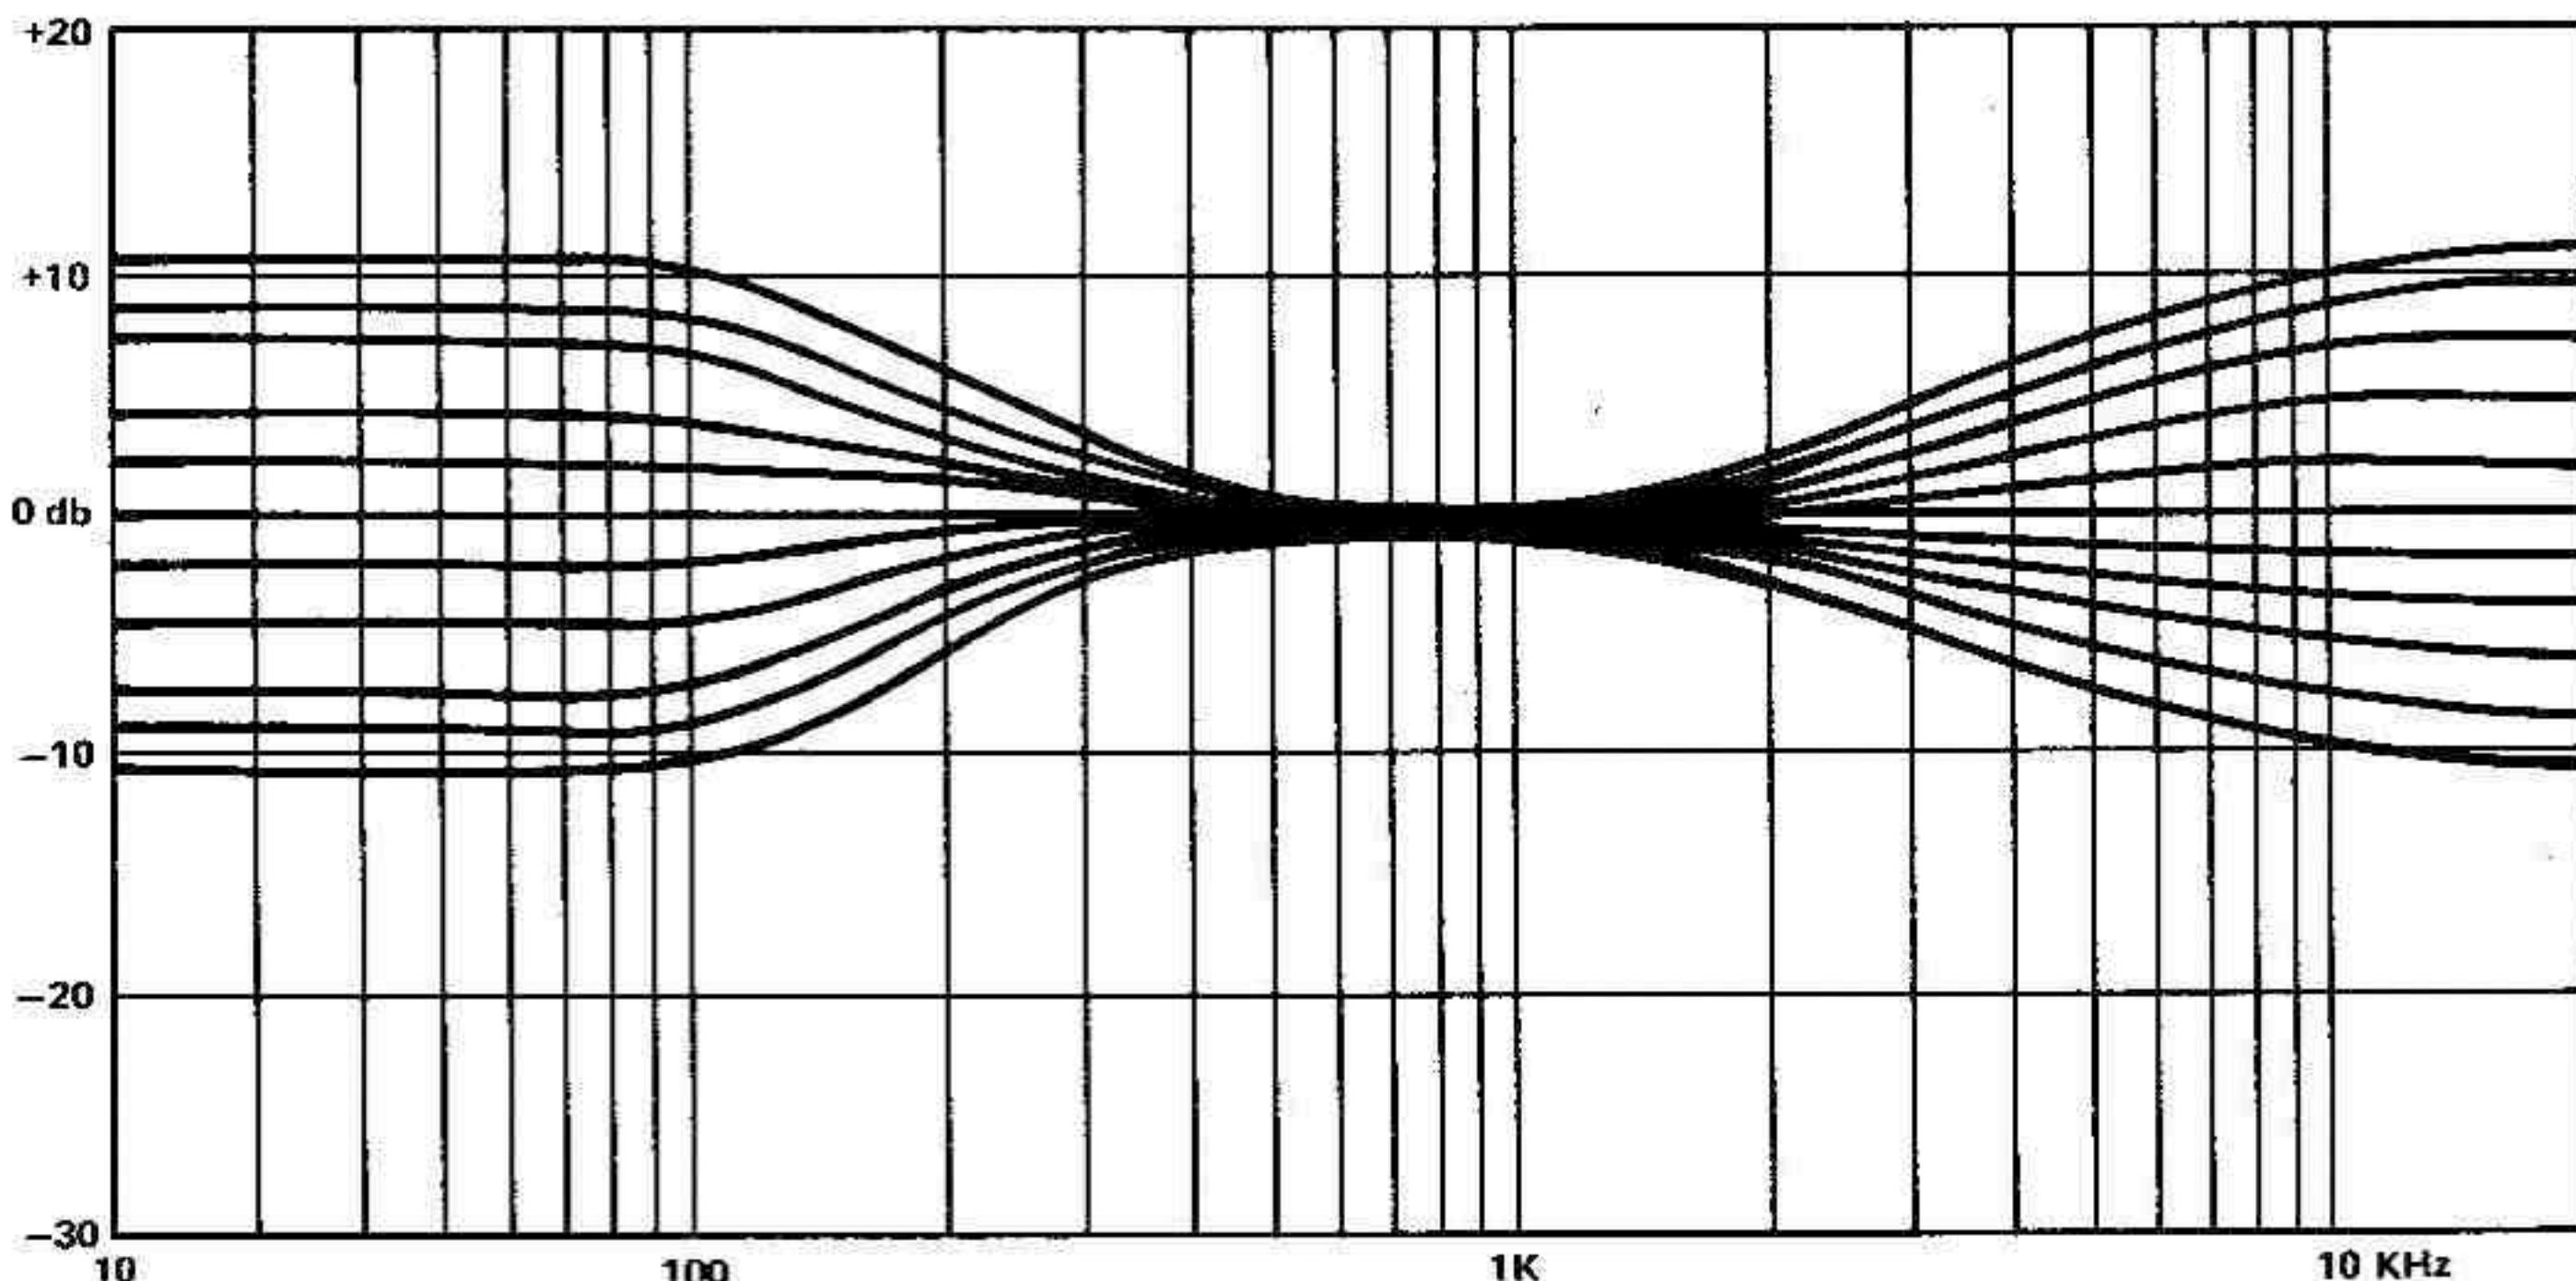

Figure 1. Tone Control Response Curves

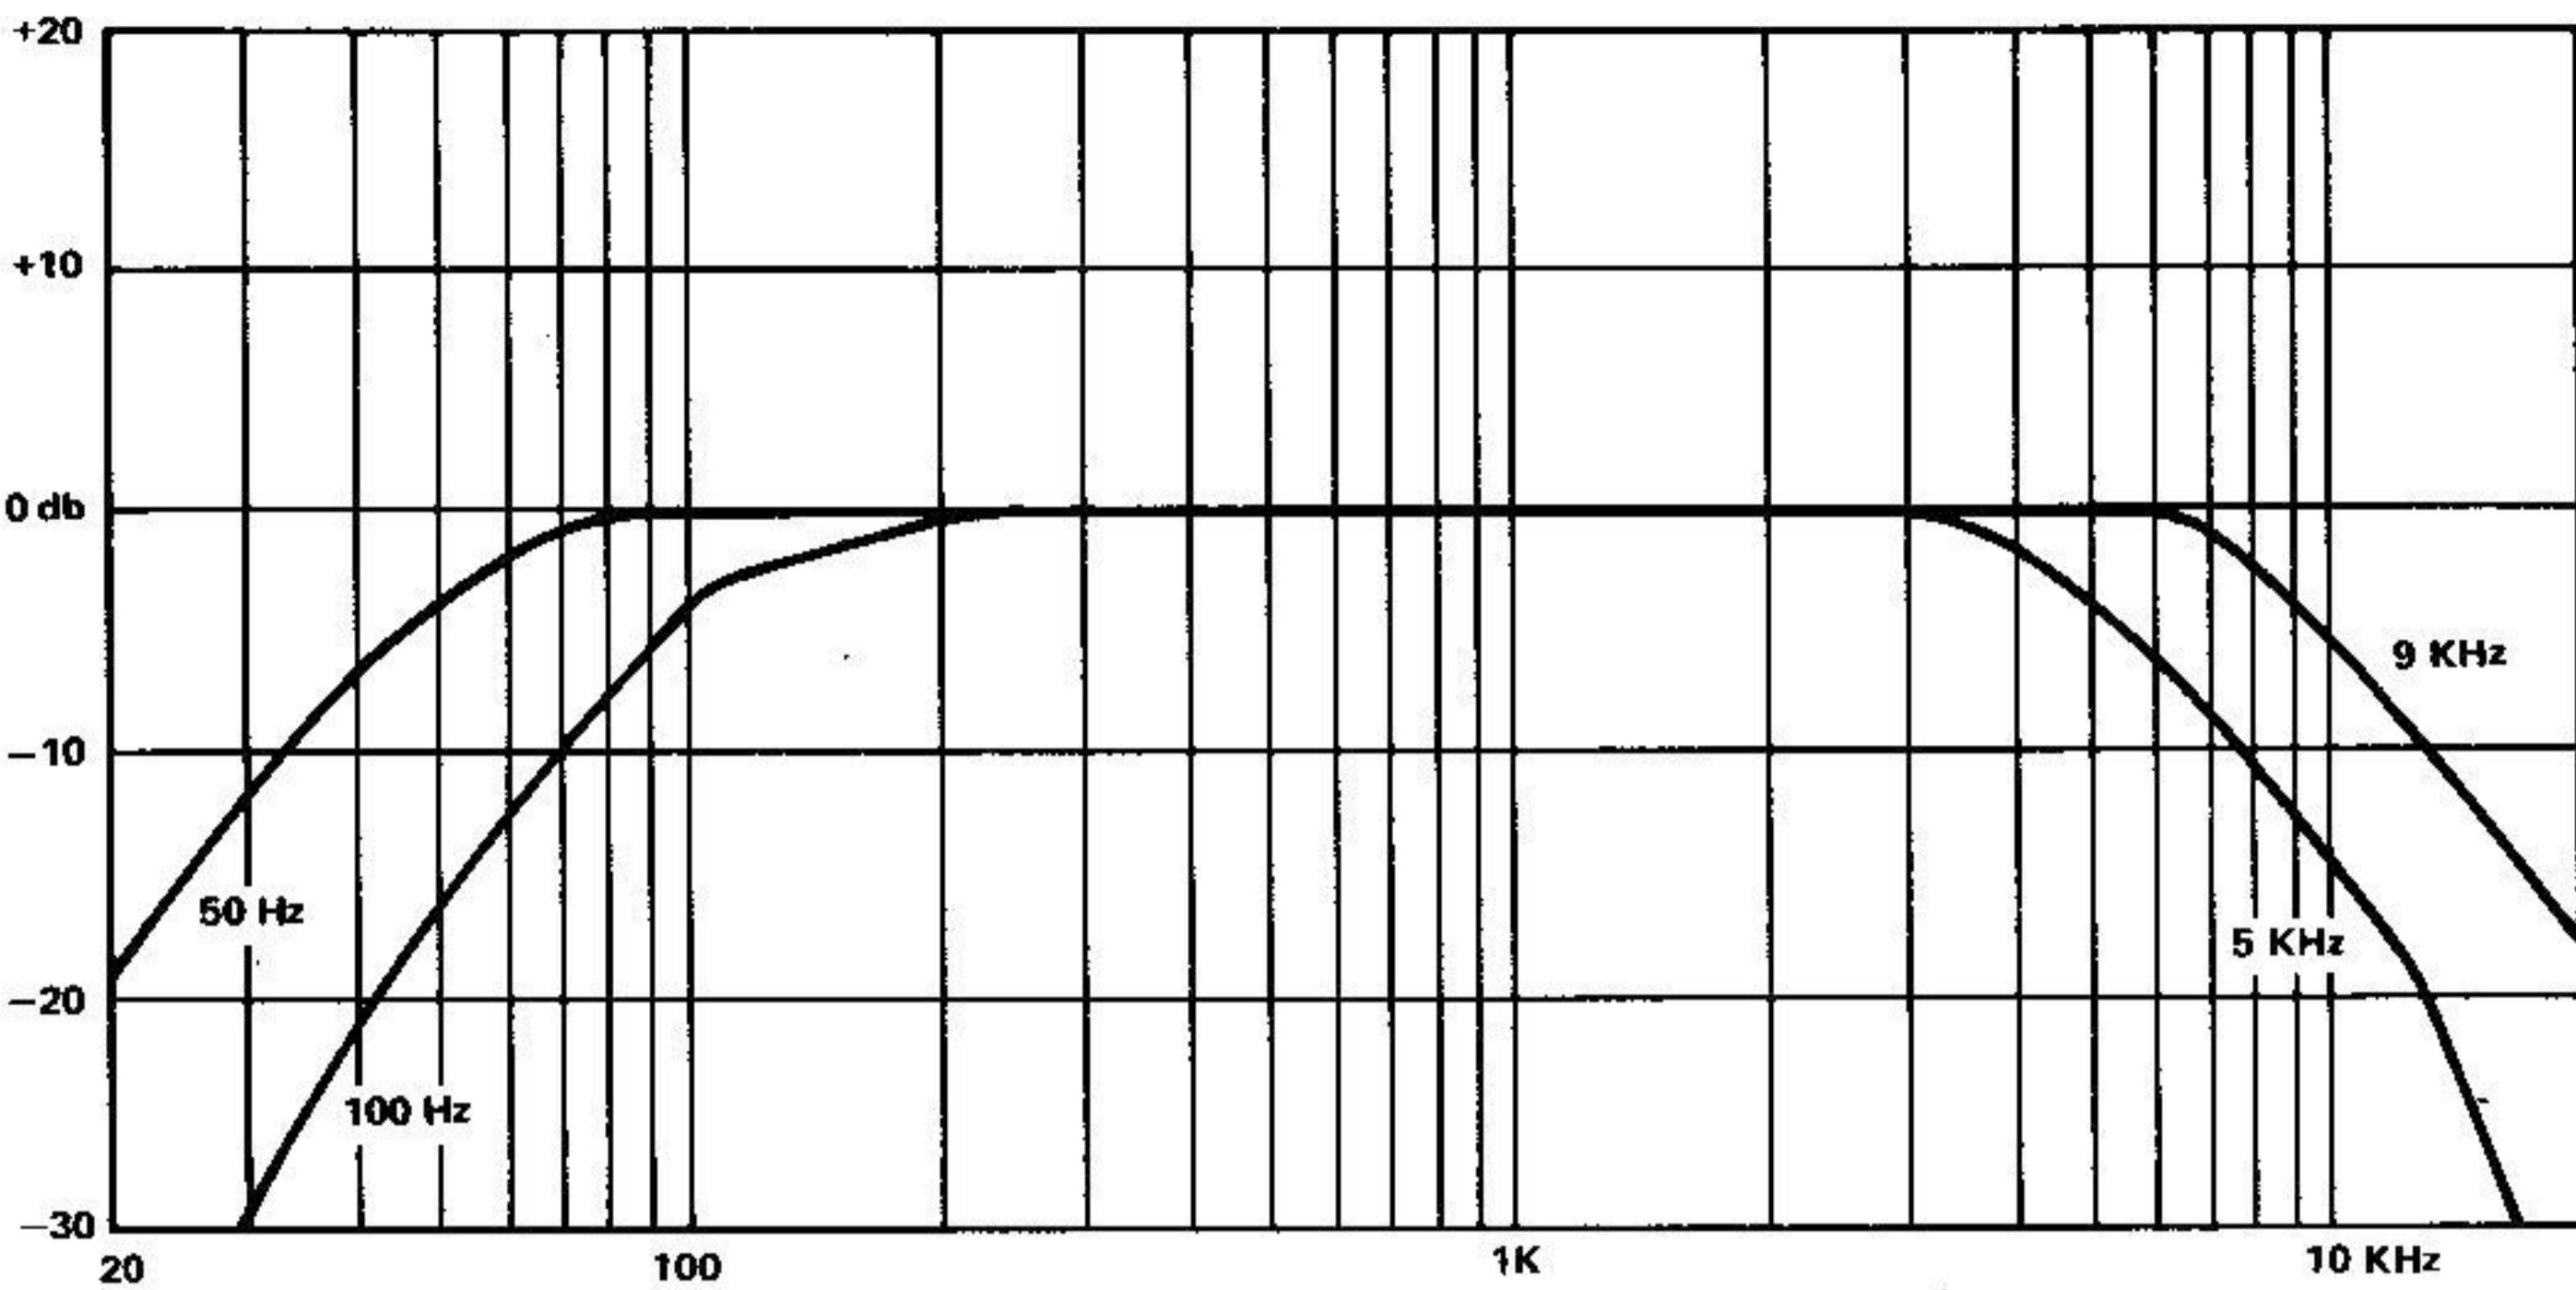

Figure 2. Filter Response Curves

HIGH and LOW FILTER

The three-position HIGH and LOW filter switches each select between two two-pole filters thus providing true double time constant functions when placed in their active positions.

When set to OUT, the filter switches bypass the filters and apply the X10 or tone amplifier signal to the unity gain output buffer amplifier.

OUTPUT AMPLIFIER

The output amplifier comprises a series pair (Q201, Q202). The output of this amplifier is applied to the PRE-AMP OUT jacks and through a running network to the CENTER CHANNEL VOLUME CONTROL. This control adjusts the level of the signal applied to the center channel amplifier. This amplifier comprises a series pair (Q205, Q206). The output of the center channel amplifier is applied to the CENTER CHANNEL OUTPUT jack.

POWER SUPPLY

The following discussion is based on the positive supply only. The negative supply operates in an identical manner.

AC voltage from T1 is rectified by the diode bridge comprising CR301 through CR304. The resulting DC voltage is amplified by a Darlington pair (Q302, Q303).

This pair is regulated by a constant-current source (Q301). Further regulation is applied by a differential amplifier (Q305, Q306) which samples the output voltage. The voltage reference for Q305 is Zener diode CR305. The adjustable voltage reference for Q306 is potentiometer R309. Overcurrent protection is provided by Q304. Excessive current causes an increased voltage drop across R306, causing Q304 to turn on and ground the input to Q302. Overload recovery is instantaneous.

240-VAC CONVERSION

To convert the Model 33 to 240-volt operation, perform the following steps:

1. Remove top and bottom covers.
2. Using the 240-volt AC conversion kit, part number 105-1003-1, attach the standoff terminal, part number 359-1002, to the chassis (in the #6 hole next to the fuseholder) with the #6-32 x 1/8 screw supplied.
3. Unsolder the gray wire from the fuseholder. Unsolder the black wire from J5 pin 2.
4. Re-route the black wire to the compartment containing the standoff terminal.
5. Solder the gray and black wire to the standoff terminal.
6. Replace the top and bottom covers.
7. Replace the 1/4 amp, 250V fuse in the unit with the 1/8 amp, 250V fuse, part number 451-1007, supplied with the conversion kit.
8. Remove the protective backing from the caution label, part number 180-1008, and place it on the top cover.

The Model 33 is now ready for 240-volt operation.

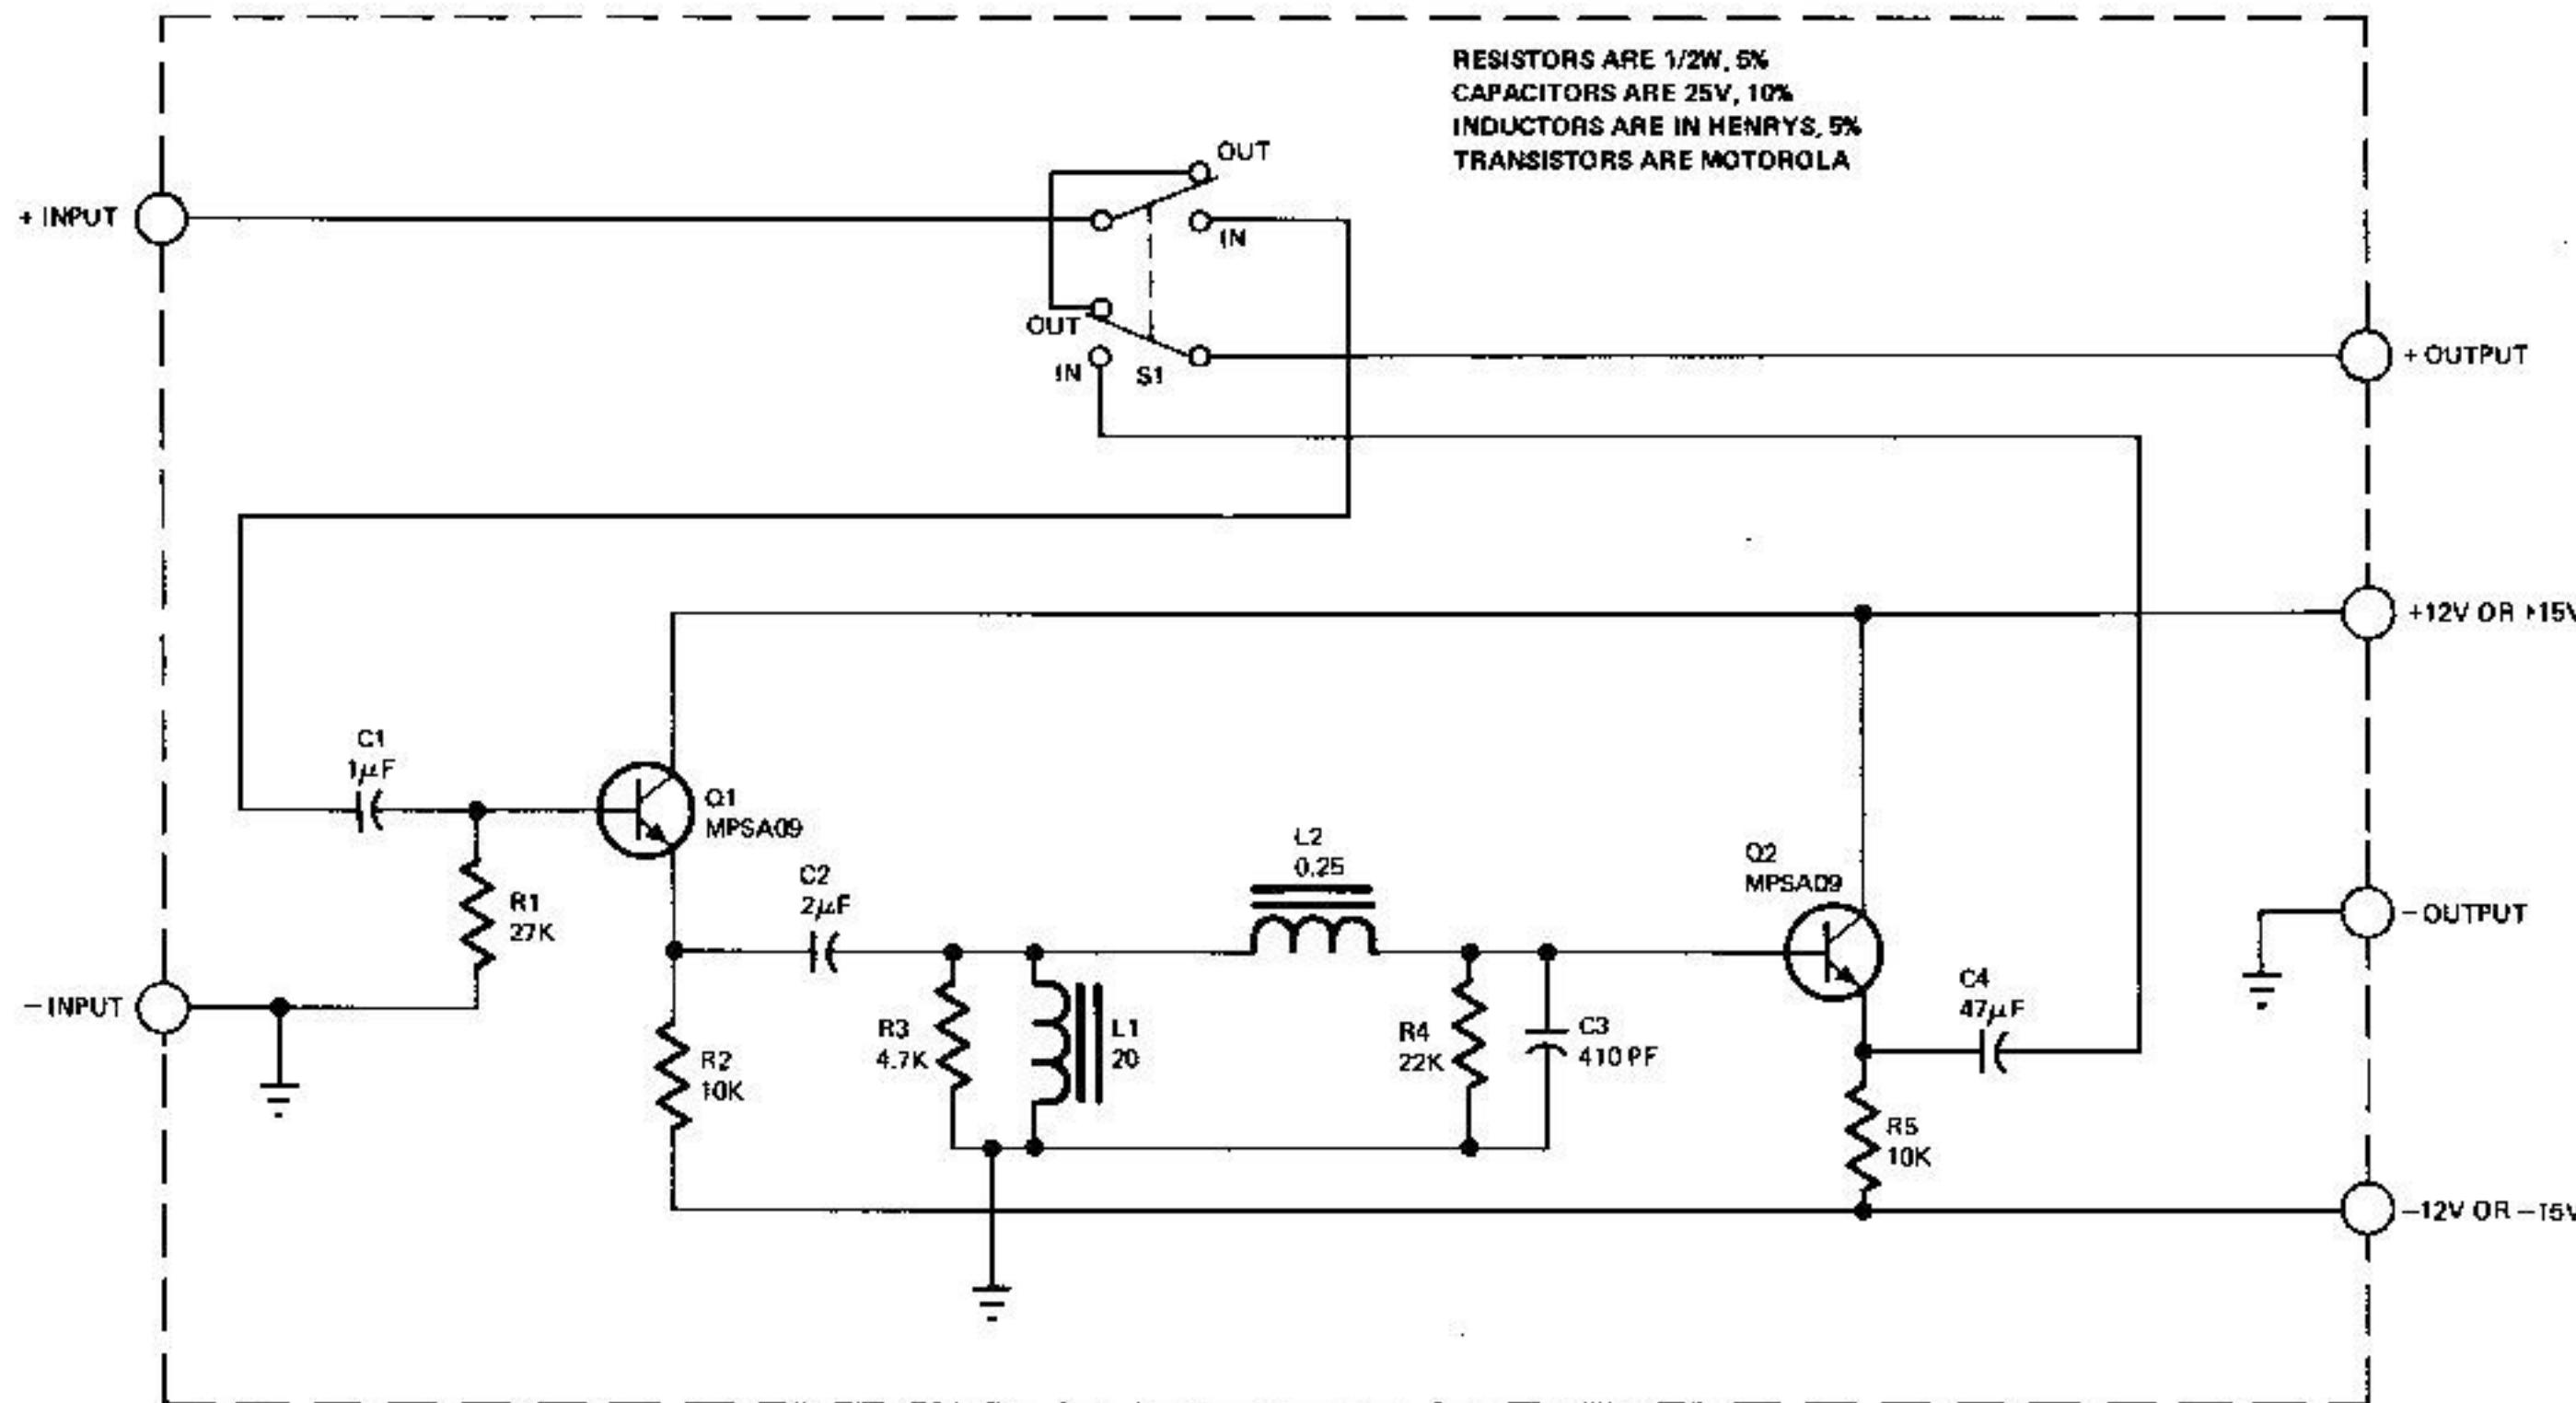

Figure 3. Band Pass Filter Schematic

TECHNICAL SPECIFICATIONS

GAIN

Phono to main output	60 dB
Phono to recording output	40 dB
High level to main output	20 dB

TOTAL HARMONIC DISTORTION

At 3 volts output – 20 Hz to 20 KHz	Less than 0.02%
---	-----------------

INTERMODULATION DISTORTION

At 3 volts output	Less than 0.02%
-----------------------------	-----------------

FREQUENCY RESPONSE

5 Hz to 100 KHz	+0, -1 dB
20 Hz to 20 KHz	-0.25 dB

TOTAL NOISE (equivalent input)

20 Hz to 20 KHz (phono input loaded and shielded)	1.0 μ V
---	-------------

DYNAMIC RANGE (S/N range)

Phono Input (equivalent noise)	118 dB above 1.0 μ V
--	--------------------------

CHANNEL SEPARATION (20 Hz to 20 KHz)

.	58 dB
-----------	-------

INPUT SENSITIVITY

Phono – for 1V output	1 mV
High level – for 1V output	100 mV

INPUT IMPEDANCE

Phono	47K ohms
Tape Head	100K ohms
High Level	50K ohms

VOLUME TRACKING (max. to -65 dB from max.)

.	within 1 dB
-----------	-------------

OUTPUT LEVEL AND IMPEDANCE

Main.	10 volts, 200 ohms
Center Channel	5 volts, 200 ohms
Tape Recorder	10 volts, 200 ohms
Headphones	10 volts, 300 ohms

TONE CONTROLS (Switch Defeatable)

Treble	\pm 10 dB at 10 KHz
Bass	\pm 10 dB at 100 Hz

FILTERS

High (5 KHz and 9 KHz)	12 dB per octave
Low (50 Hz and 100 Hz)	12 dB per octave

NUMBER OF SEMI-CONDUCTORS

Revision 1.	6 F.E.T's, 52 Transistors, 8 Diodes
Revision 2	2 F.E.T's, 52 Transistors, 8 Diodes

POWER REQUIREMENTS

105 to 125 volts AC, 50/60 Hz, 10 Watts

DIMENSIONS

5-3/4" High, 15-3/4" Wide, 8-3/4" Deep

WEIGHT

Unit	12 lbs.
Shipping	16 lbs.

TEST EQUIPMENT REQUIRED FOR SERVICING

Table 1 lists the test equipment required for servicing the Model 33 Stereo Console. The wattmeter ac voltmeter, and variac may be assembled as a test fixture as shown schematically in Figure 4.

Item	Manufacturer and Model Number (or equivalent)	Use
Distortion Analyzer	Hewlett Packard, Model 333A or 331A	Measures distortion and voltage.
Audio Oscillator	Weston Model CVO-100P (Note: Less than 0.01 per cent residual distortion is required.)	Sine wave signal source.
Oscilloscope	Tektronix Model 503, Data Model 555	Waveform analysis and trouble shooting.
VTVM	RCA Senior Volt-Ohmyst Model MV-98C.	Voltage and resistance measurements.
AC Wattmeter	Simpson Model 390	Monitors primary power consumption.
Line Voltmeter (0 to 150 VAC)	Commercial Grade	Monitors primary power potential.
Variable Autotransformer (0-140 vac, 10 Amps)	Powerstat Model 116B	Adjust level of primary power.
Shorting Plug	Use phono plug with 600 ohms across center pin and shell	Shorts inputs to eliminate noise pick up.
Bandpass Filter	Fabricate in accordance with Figure 3	Eliminates broadband noise when checking noise spec.

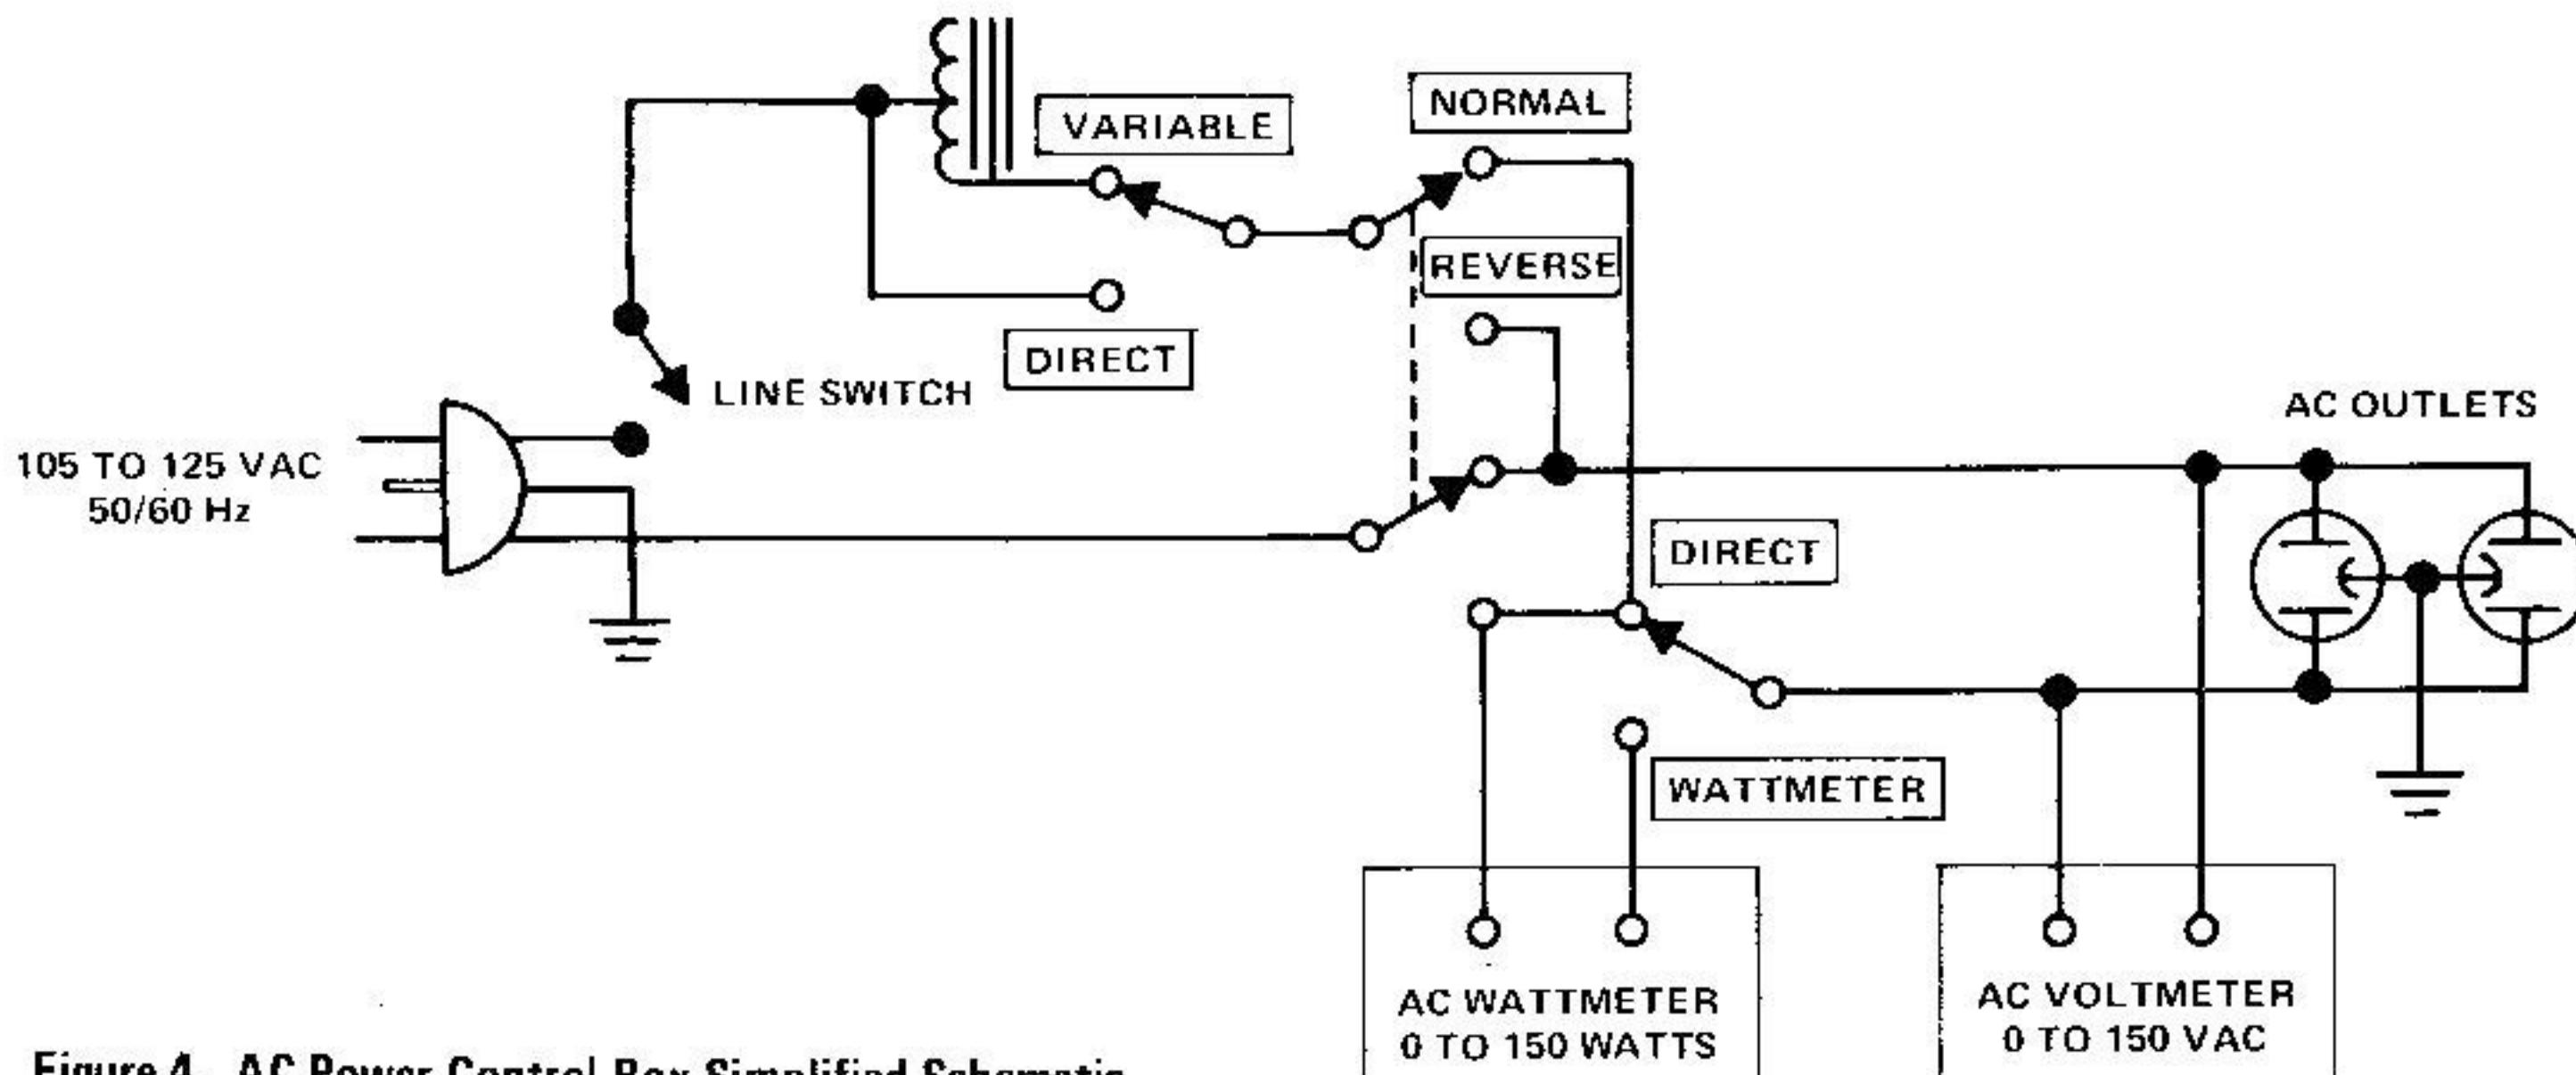

Figure 4. AC Power Control Box Simplified Schematic

PERFORMANCE VERIFICATION

TEST PROCEDURE

INITIAL SET-UP

Connect test equipment as shown in Figure 5. The following procedure is to be followed each time the equipment is tested and after every repair.

INITIAL SWITCH POSITIONS

Line Switch	Off
Variac	0 Volts
Bandpass	Out
MODEL 33	
Selector	Aux 1
Mode	Stereo
Tone Control	In (Bass and Treble: 0 dB)
Tape Monitor	Out
Volume	Maximum
Balance	Centered
Filters	Out
Headphone	Maximum
Power	Off
Center Channel Volume	Maximum

A. Power Consumption

1. Set line switch to ON.
2. Set Model 33 POWER switch to ON.
3. Slowly increase variac setting until line voltmeter reads 120V.
4. AC wattmeter should indicate less than 5 watts. If wattmeter indicates more than 5 watts, stop test and proceed to Trouble Analysis section of this manual.

B. Functional

1. Using audio oscillator, oscilloscope, and voltmeter section of distortion analyzer perform functional check of all controls and jacks.
2. Verify normal operation before proceeding with remaining tests.

NOTE: The following tests should be performed for both channels.

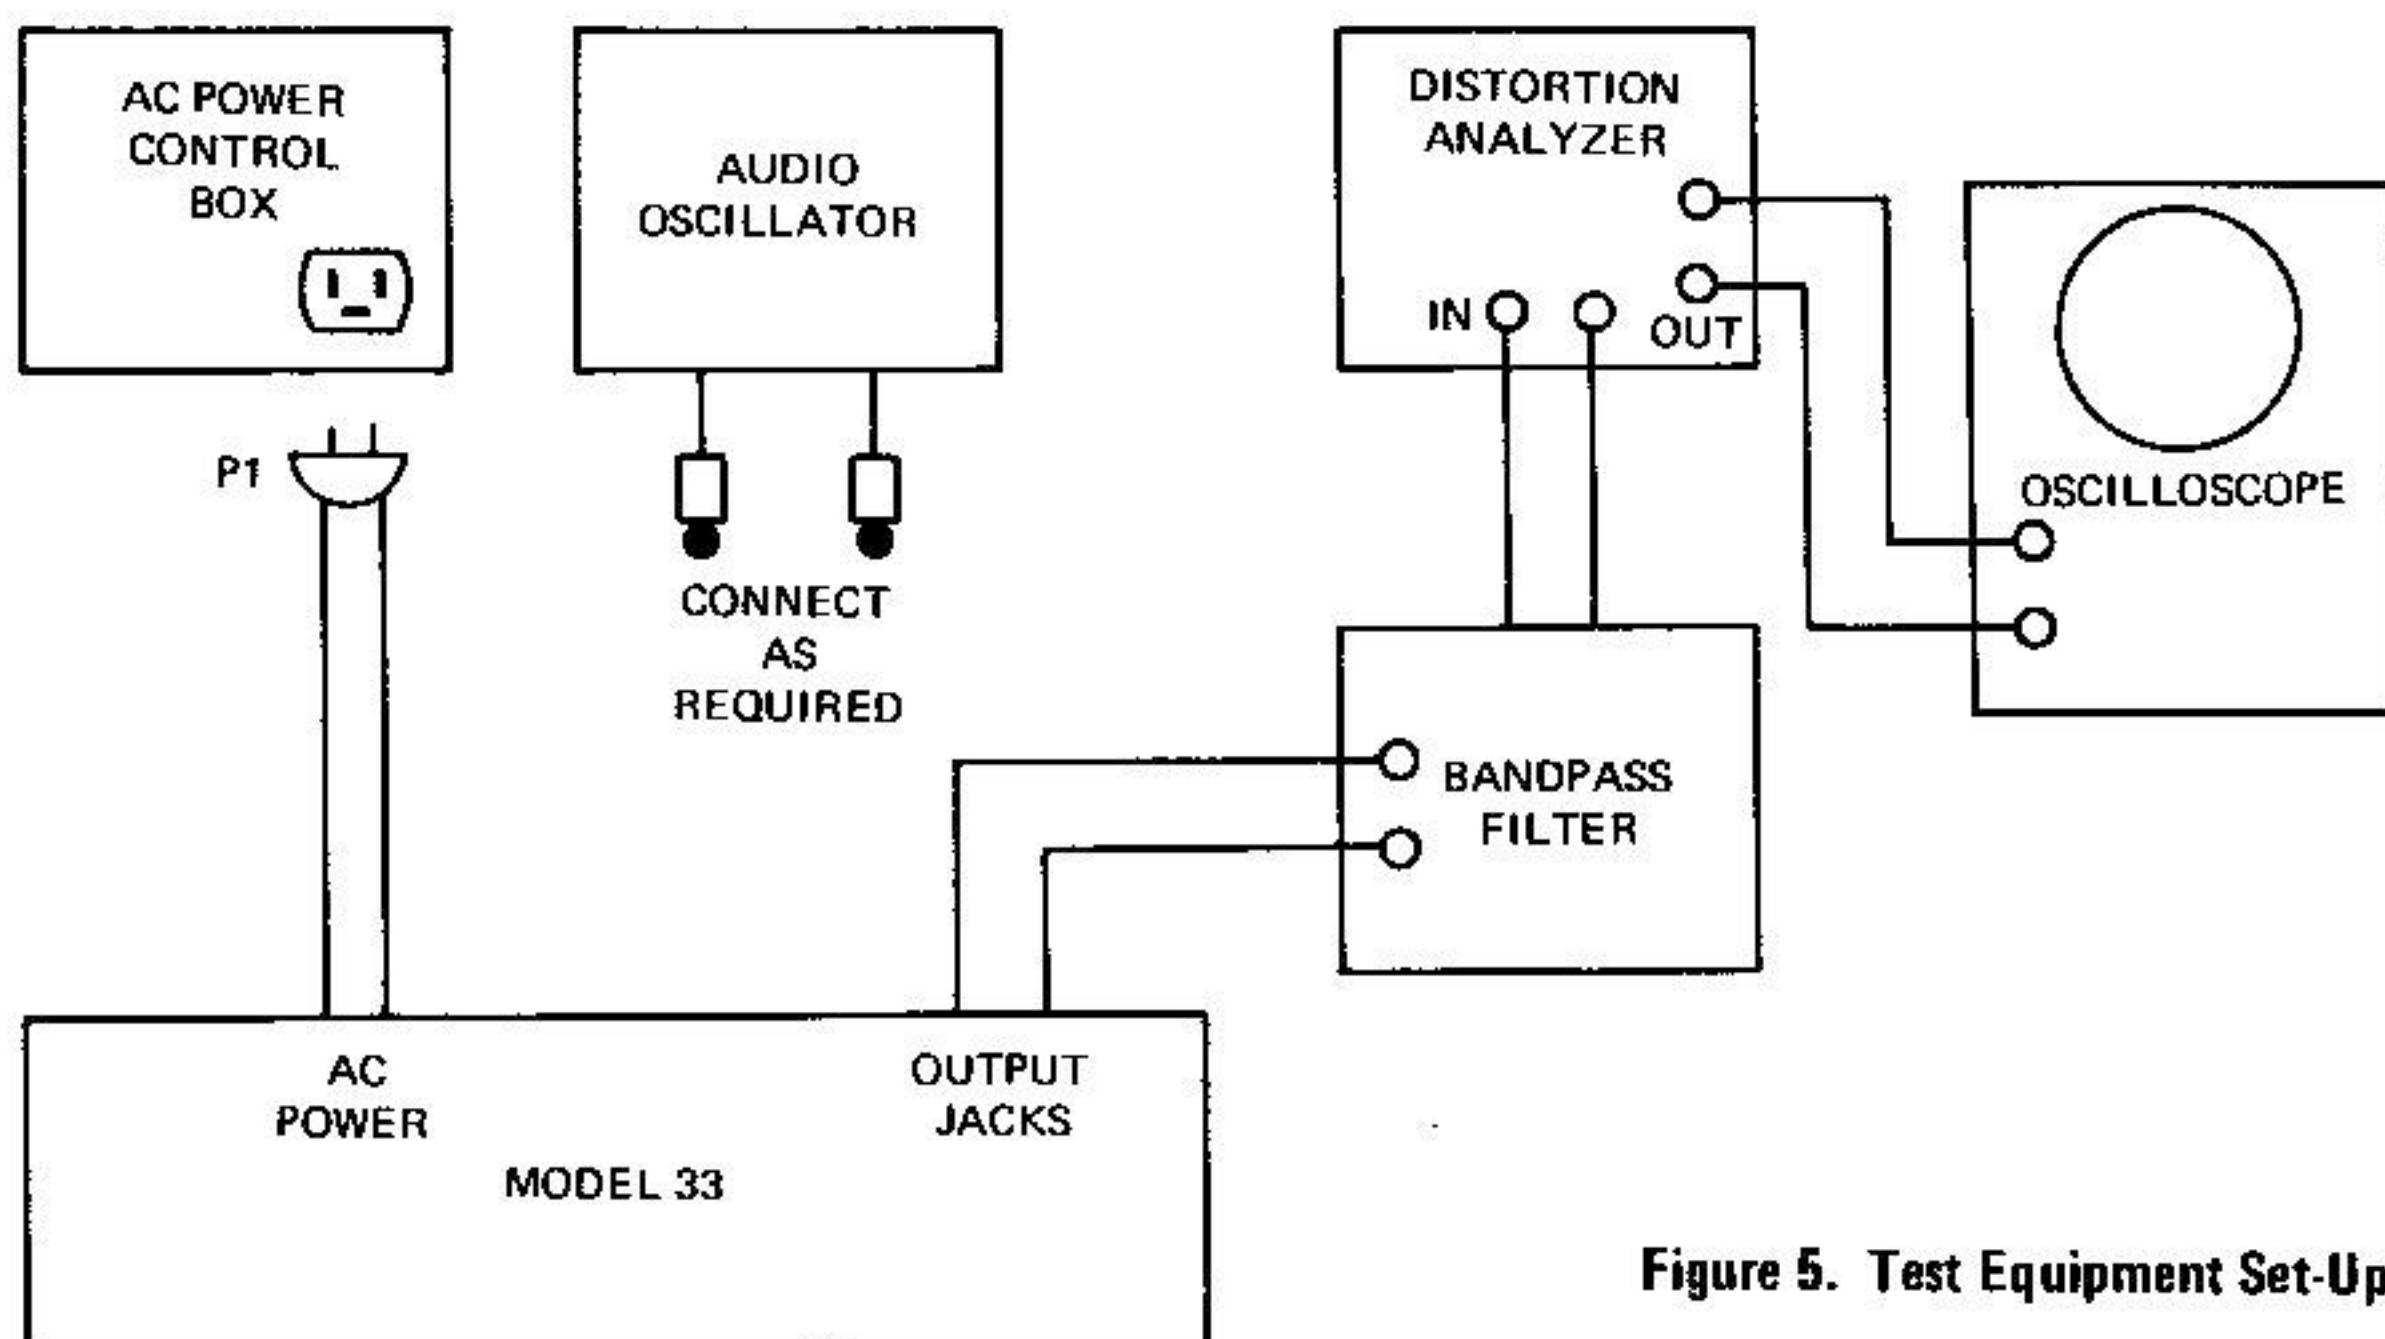

Figure 5. Test Equipment Set-Up.

C. Hum and Noise

1. Set SELECTOR switch to PHONO 1.
2. Insert shorting plugs in PHONO 1 jacks.
3. Set bandpass switch to IN.
4. Using distortion analyzer, measure output voltage. Voltage should be less than 1.5 mv.
5. Set SELECTOR switch to TUNER.
6. Insert shorting plugs in TUNER jacks.
7. Measure output voltage. Voltage should be less than $60\mu\text{v}$.
8. Set bandpass switch to OUT.

D. Maximum Output

1. Set selector switch to AUX 1.
2. Connect AUDIO OSCILLATOR to AUX 1 input jacks.
3. Set oscillator frequency to 1 KHz ± 20 Hz.
4. Adjust oscillator output until just before oscilloscope indicates clipping.
5. Measure output voltage. Voltage must be greater than 8V.

E. Balance

1. Reduce oscillator output until distortion analyzer voltmeter indicates 0 dB on channel A.
2. Measure channel B output. Voltage should be $0 \text{ dB} \pm 2 \text{ dB}$.

NOTE: Adjust for as close a balance as possible for the remaining tests.

F. Frequency Response

1. Tape Head
 - a. Set SELECTOR switch to TAPE HEAD.
 - b. Connect oscillator to TAPE HEAD input jacks.
 - c. Set oscillator frequency to 500 Hz.
 - d. Adjust oscillator level for 0 dB output at distortion analyzer.
 - e. Set oscillator frequency to 50 Hz. Analyzer should indicate $+17.5 \text{ dB} \pm 1 \text{ dB}$, Figure 6.
 - f. Set oscillator frequency to 10 KHz. Analyzer should indicate $-15.5 \text{ dB} \pm 1 \text{ dB}$, Figure 6.

2. Phono

- a. Set SELECTOR switch to PHONO 1.
- b. Connect oscillator to PHONO 1 input jacks.
- c. Set oscillator frequency to 1 KHz.
- d. Adjust oscillator level for 0 dB at distortion analyzer.
- e. Set oscillator for 30 Hz. Analyzer should indicate $+18.61 \text{ dB} \pm 1 \text{ dB}$, Figure 6.
- f. Set oscillator for 15 KHz. Analyzer should indicate $-17.17 \text{ dB} \pm 1 \text{ dB}$, Figure 6.

3. High Level

- a. Set SELECTOR switch to AUX 1.
- b. Connect oscillator to AUX 1 input jacks and set frequency to 1 KHz.
- c. Adjust oscillator level until analyzer indicates 0 dB.
- d. Set oscillator for 20 Hz. Analyzer should indicate $0 \text{ dB} +0, -0.25 \text{ dB}$.
- e. Set oscillator for 20 KHz. Analyzer should indicate $0 \text{ dB} +0, -0.25 \text{ dB}$.
- f. Set oscillator for 60 KHz. Analyzer should indicate $0 \text{ dB} +0, -0.25 \text{ dB}$.

4. Low Filter

- a. Set oscillator to 50 Hz.
- b. Set LOW filter switch to 50. Analyzer should indicate $-3 \text{ dB} \pm 1.5 \text{ dB}$.
- c. Set oscillator to 100 Hz.
- d. Set LOW filter switch to 100. Analyzer should indicate $-3 \text{ dB} \pm 1.5 \text{ dB}$.
- e. Set LOW filter switch to OUT.

5. High Filter

- a. Set oscillator to 5 KHz.
- b. Set HIGH filter switch to 5K. Analyzer should indicate $-3 \text{ dB} \pm 1.5 \text{ dB}$.
- c. Set oscillator to 10 KHz.
- d. Set HIGH filter switch to 9K. Analyzer should indicate $-5 \text{ dB} \pm 1.5 \text{ dB}$.
- e. Set HIGH filter switch to OUT.

6. Tone Controls

- a. Set oscillator to 1 KHz. Ensure tone control pots are in center position and analyzer indicates 0 dB.
- b. Adjust tone control pots to maximum boost (upper position).
- c. Set oscillator to 100 Hz. Analyzer should indicate $+10 \text{ dB} \pm 2 \text{ dB}$.
- d. Set oscillator to 10 KHz. Analyzer should indicate $+10 \text{ dB} \pm 2 \text{ dB}$.
- e. Adjust tone control pots to maximum cut (lower position).
- f. Analyzer should indicate $-10 \text{ dB} \pm 2 \text{ dB}$.
- g. Set oscillator to 100 Hz. Analyzer should indicate $-10 \text{ dB} \pm 2 \text{ dB}$.
- h. Adjust tone control pots to mechanical center.
- i. Set oscillator to 1 KHz. Analyzer should indicate 0 dB.
- j. Set TONE CONTROL switch to OUT. Analyzer should indicate $0 \text{ dB} \pm 1 \text{ dB}$.

7. Loudness

- a. Set oscillator to 100 Hz. Set TONE CONTROL switch to IN.
- b. Adjust oscillator level for 0 dB at analyzer.

- c. Set VOLUME control to minimum. Set TONE CONTROL switch to LOUDNESS.
- d. Adjust volume control for an indication on analyzer of -20 dB.
- e. Set oscillator to 10 KHz. Analyzer should indicate $-20 \text{ dB} \pm 2 \text{ dB}$.
- f. Set oscillator to 1 KHz. Analyzer should indicate $-27 \text{ dB} \pm 2 \text{ dB}$.
- g. Set TONE CONTROL switch to IN. Set VOLUME control to maximum.

G. Harmonic Distortion

1. Set oscillator to 20 Hz.
2. Adjust oscillator level for 3V on both channels. (Adjust BALANCE control if necessary.)
3. Set analyzer to SET LEVEL - MANUAL.
4. Adjust sensitivity vernier for full scale deflection (0-1 scale).
5. Set analyzer to DISTORTION. Analyzer should indicate less than 0.01%.
6. Set oscillator to 20 KHz.
7. Repeat steps 3 through 5.
8. Analyzer should indicate less than 0.01%.

NOTE: Adjust R127 as necessary to meet 20 KHz spec.

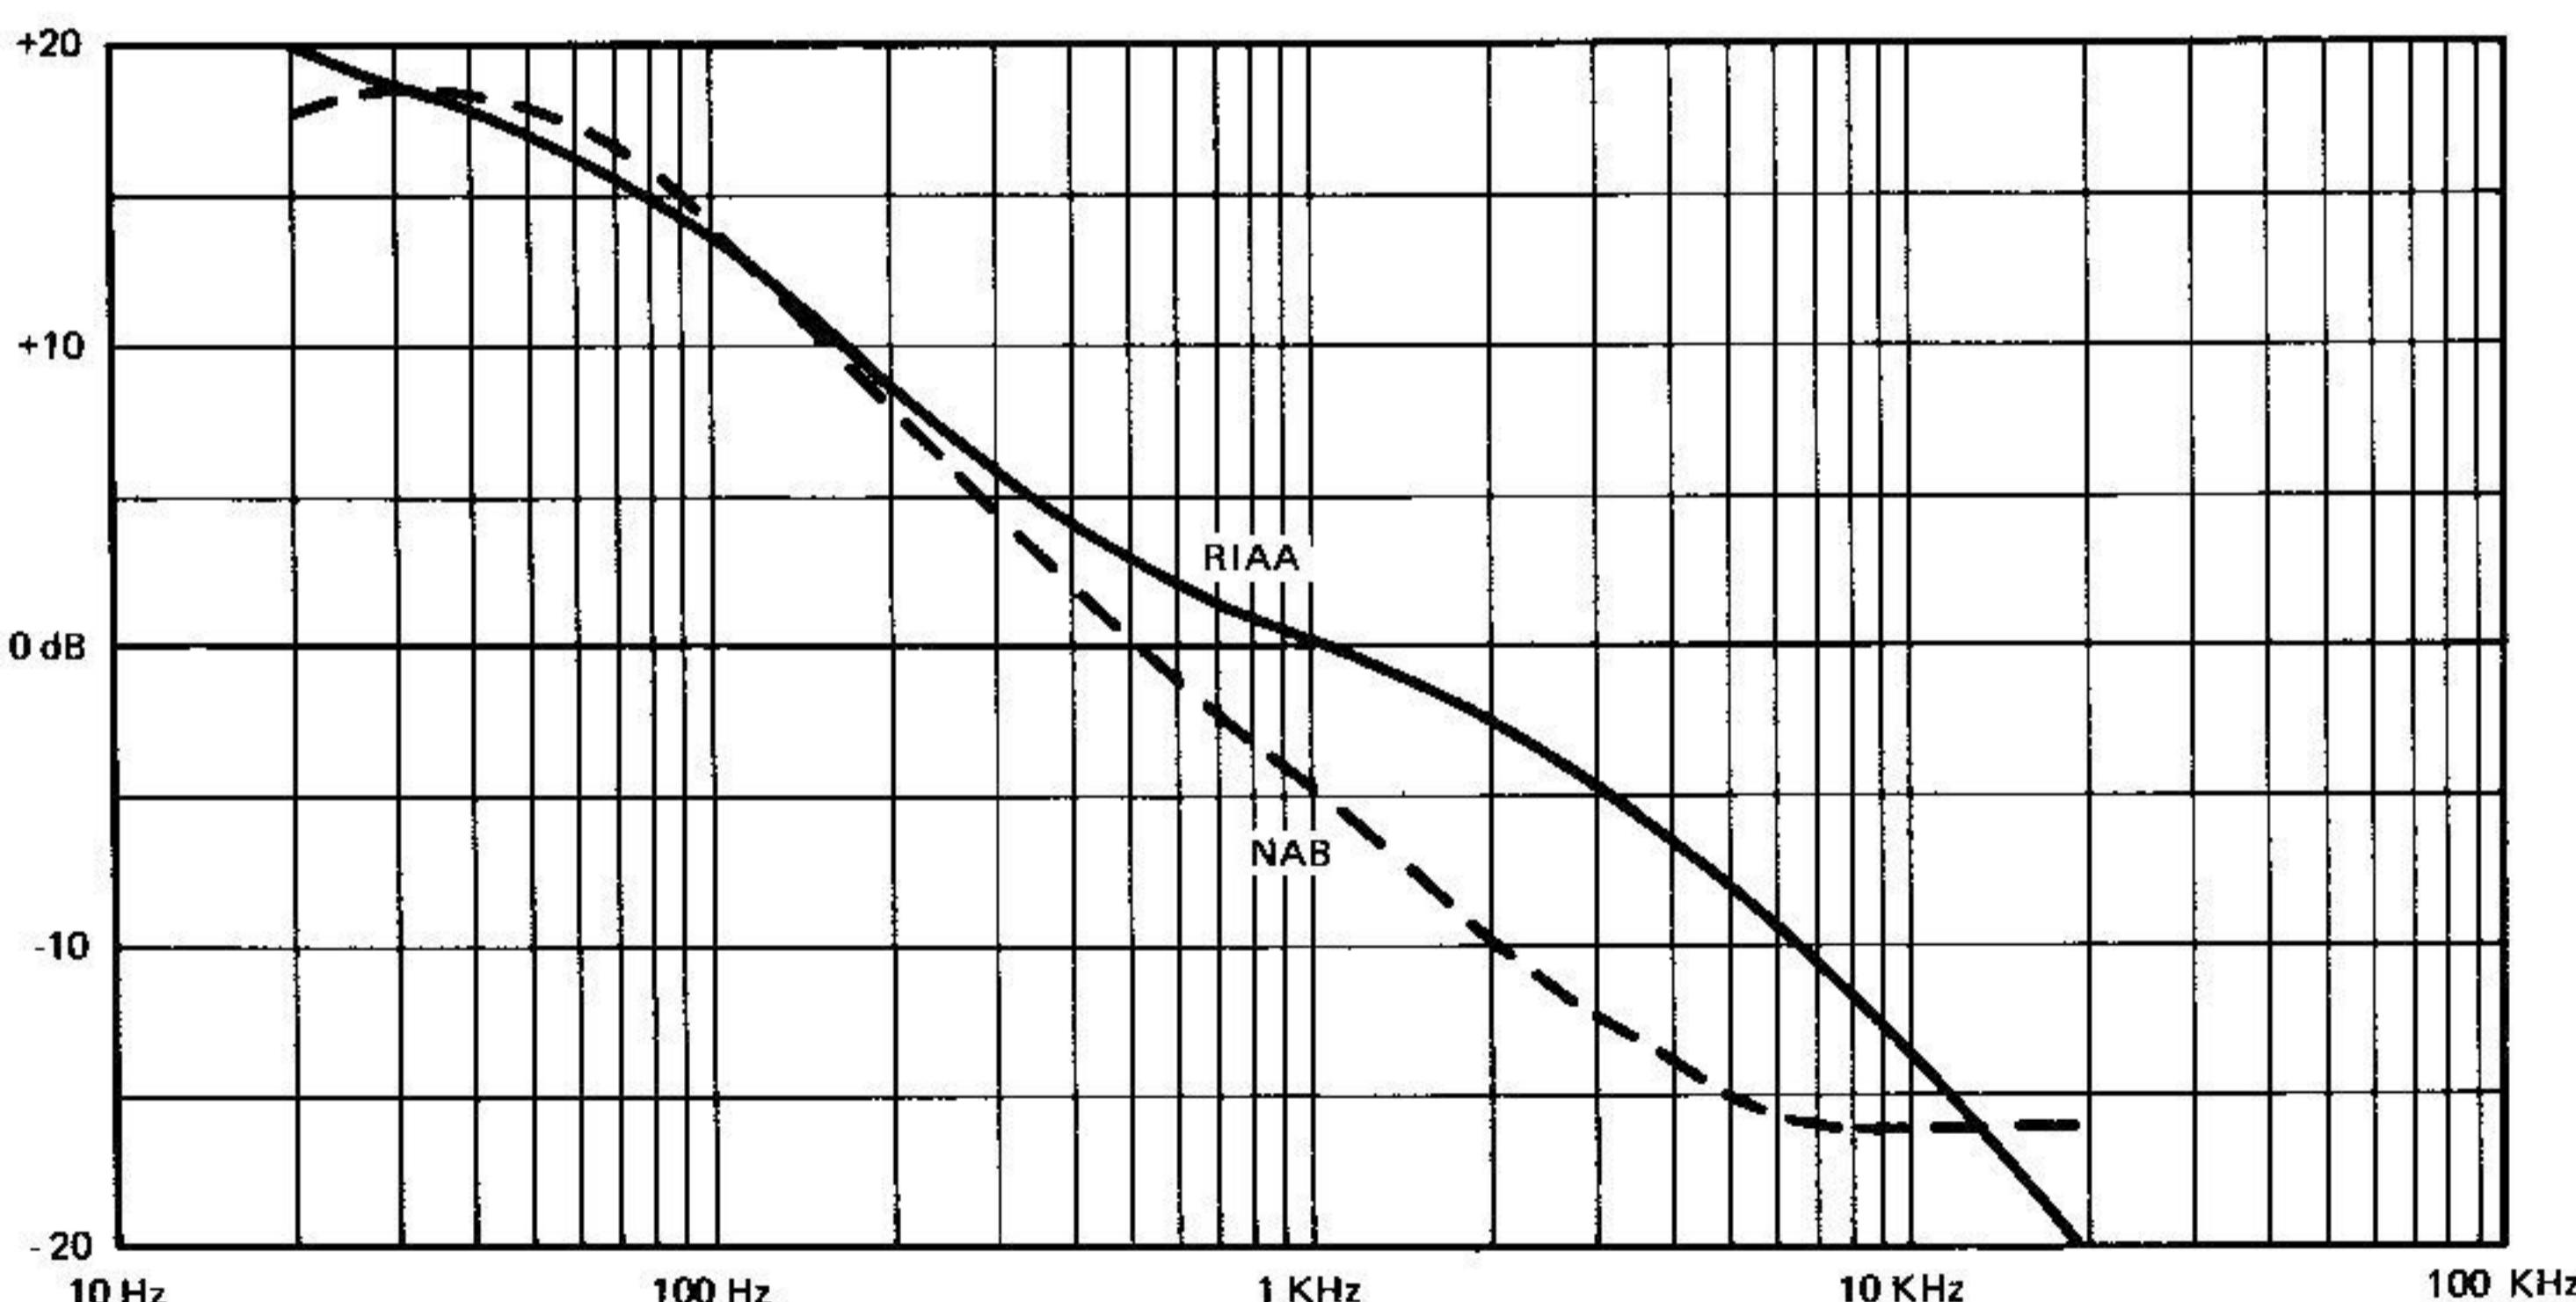

Figure 6. NAB and RIAA Equalization Curves

TROUBLE ANALYSIS

The trouble analysis procedure that follows contains typical trouble symptoms and their remedies. Other field problems will be covered through service bulletins (supplementary to this manual) which will be issued to all stations. The schematic diagrams (Figures 9, 11, and 13) contain typical voltages taken at various test points in a properly operating amplifier.

NOTE: Performance Verification is necessary following any repair.

SYMPTOM

1. Excessive Line Consumption
2. No Line Consumption
3. High Hum and Noise Level
4. High Distortion or Improper Clipping

PROCEDURE

- a. Check for shorted rectifier CR301 through CR304
- b. Check capacitors C301, C302, C305, C306
- c. Check for shorted transistors Q301, Q302, Q303, Q305 through Q309, Q311, Q312. Check for open Q304 and Q310
- d. Check for shorted T1
- a. Check line cord, fuse
- b. Check for open transistors Q301, Q302, Q303, Q305 through Q309, Q311, Q312. Check for shorted Q304, Q310.
- c. Check for open rectifiers CR301 through CR304
- d. Check for open T1
- a. Check filter capacitors C301, C302, C304, C305, C306, C308
- a. Check FET's Q106, Q109
- b. Check setting of DC OFFSET ADJUST potentiometer R127

DETAIL A
SIDE VIEW SHOWN

NOTES: UNLESS OTHERWISE SPECIFIED:

- 1** C101, C110, C119, C121, C127 AND C128 POLARIZATION IS DETERMINED BY HOLDING THE COMPONENT WITH THE MULTIPLIER DOT FACING THE VIEWER - IN THIS POSITION THE POSITIVE LEAD IS ON THE RIGHT.
- 2** 122 AWG TCI BUS WIRE ON COMPONENT SIDE.
- 3** INSULATOR TO BE INSTALLED BETWEEN BOARD AND TRANSISTORS, Q119 AND Q120 ONLY.
- 4** BUS WIRE JUMPER BETWEEN R104 AND R105 INSTALLED ONLY ON BOARDS MARKED A/W 115-1014, REV. A.
- 5** ASSEMBLY CONFIGURATION SHOWN IS TYPICAL FOR BOARDS FABRICATED FROM A/W 115-1014, REV. B.
- 6** Q106 AND Q109 ARE TO BE COLOR MATCHED BY RANGE.
- 7** HEAD OF SCREW TO BE ON CIRCUIT SIDE OF BOARD.
- 8** Q101 THRU Q118 ARE TO BE INSTALLED WITHOUT CUTTING TRANSISTOR LEADS.
- 9** WHEN REQUIRED, R179 WILL BE SELECTED AT TEST AND MOUNTED AS SHOWN IN DETAIL A.
- 10** VALUE OF C106 MAY BE 32 MFD @ 10V WHEN REQUIRED BY TEST.

Figure 7. Preamplifier Board Component Assembly Diagram – Revision 1

PARTIAL VIEW – REMAINDER SAME AS REVISION 1

NOTES:

- 1 ASSY 200-1015-3 IS IDENTICAL TO ASSY 200-1015-1 EXCEPT THAT Q101 AND Q102 (AND TRANSISTOR SOCKETS) ARE MOUNTED ON CIRCUIT SIDE OF BOARD.
- 2 ASSY NOTES FOR REVISION 2 ARE THE SAME AS FOR REVISION 1 EXCEPT NOTE 6 IS NOT APPLICABLE.
